Some cases of diabetes insipidus occur because of an issue with the thirst function. Similar damage to the hypothalamus that causes neurogenic diabetes insipidus can also result in a malfunction to the thirst mechanism, resulting in thirst that won't go away.

Diabetes Insipidus

Diabetes insipidus is not related to diabetes, but it does share some of the same signs and symptoms. The 2 main symptoms of diabetes insipidus are: extreme thirst (polydipsia) peeing a lot, even at night (polyuria) In very severe cases of diabetes insipidus,

Disorder characterised by polydipsia, polyuria, and formation of inappropriately hypotonic (dilute) urine. Two types exist: central diabetes insipidus (DI), due to reduced synthesis or release of arginine vasopressin (AVP) from the hypothalamo-pituitary axis; and nephrogenic DI, due to renal insensitivity to AVP.

...

Diabetes insipidus is a condition in which the body cannot retain enough water. The patient is excessively thirsty and excretes large amounts of extremely diluted urine. It causes intense thirst and excretion of large amounts of urine. A reduction in fluid intake does not reduce amounts and consistency of urine excretion.

sound similar, they're not related.

Diabetes insipidus - Symptoms and causes - Mayo Clinic

Diabetes insipidus is a rare disorder that occurs when a person's kidneys pass an abnormally large volume of urine that is insipid—dilute and odorless. In most people, the kidneys pass about 1 to 2 quarts of urine a day. In people with diabetes insipidus, the kidneys can pass 3 to 20 quarts of urine a day.
