General Ontological Language (GOL) is a formal framework for representing and building ontologies. The purpose of GOL is to provide a library of top-level ontologies which can be used as a framework for building more specific ontologies. This report is a living document of the GOL-project of the University of Leipzig.

An investigation into the structure of basic description logics (DL) has identified the needed semantic extensions to enable the web ontology language (OWL) as the ontological language for our framework. The DL has been found to be the most appropriate logic-based knowledge formalism as it maps to OWL 2 and ensures its decidability.

To show how an ontological problem-solving framework can address the challenge of matching sensor systems to compatible algorithms for a specific task, a family of unattended ground profiling sensors (denoted as PFx, in which PF 1, PF 2, ..., PF n are different types of profiling sensors) and algorithms were deployed in a prototype environment. PFx sensor systems provide unique opportunities for dynamic feature extraction through extendable algorithms and subsequent tasking.
