And the image below shows that it is also true the other way round: Now, the above is true in general for the Fourier transform. But in signal processing and the world of discrete data, we are doing a discrete Fourier transform with the FFT. So in practice, both the real and the Fourier domains are given by samples. This means that they are ...

Sampling Theory, Signal Processing, and Data Analysis

Digital image processing is the use of a digital computer to process digital images through an algorithm. As a subcategory or field of digital signal processing, digital image processing has many advantages over analog image processing. It allows a much wider range of algorithms to be applied to the input data and can avoid problems such as the build-up of noise and distortion during processing. Since images are defined over two dimensions digital image processing may be modeled in the form of m
