Particularly in superstring theory, the extra dimensions of spacetime are sometimes conjectured to take the form of a 6-dimensional Calabi-Yau manifold, which led to the idea of mirror symmetry. Their name was coined by Candelas et al. (1985), after Eugenio Calabi (1954, 1957) who ...

The second studies Calabi-Yau manifolds and mirror symmetry, using algebraic geometry. The final part describes compact hyperkahler manifolds, which have a geometric structure very closely related to Calabi-Yau manifolds. The book is an introduction to a very active field of research, on the boundary between mathematics and physics.

'Calabi-Yau manifolds and related geometries', by Mark Gross, Daniel Huybrechts and Dominic Joyce There are many texts concerning the aspects of mirror symmetry having to do with variations of Hodge structure and counting curves, but only difficult research articles about the more recent geometry of mirror symmetry having to do with D-branes, homological mirror symmetry and torus fibrations.

Review of 'Calabi-Yau manifolds and related geometries'

Moore (2007) has shown that Calabi-Yau manifolds with complex structure located at an attractor fixed point on the moduli space exhibit interesting arithmetic properties. Calabi-Yau Manifolds in Physics. Calabi-Yau manifolds admit Kähler metrics with vanishing Ricci curvatures. They are solutions of the Einstein field equation with no matter. The theory of motions of loops inside a Calabi-Yau manifold provide a model of a conformal field theory.

Calabi-Yau manifold - Scholarpedia

One benefit of the Calabi-Yau manifolds was that the geometry of the folded dimensions gives rise to different types of observable particles in our universe. If the Calabi-Yau shape has three holes (or rather higher-dimensional analogs of holes), three families of particles will be predicted by the Standard Model of particle physics.

In particular, a Calabi-Yau (CY) manifold ia a (compact) Kähler manifold with vanishing Ricci curvature and so a vacuum solution of the Einstein equations. They have a prominent role in superstring theory and have been a central focus in both contemporary mathematics and math-ematical physics.

As special classes of compact complex manifolds, Calabi-Yaus and Fanos admit some features that make them easier to study than other classes. Calabi-Yaus satisfy a particularly strong PDE that Ric = 0, the Ricci tensor of a metric vanishes.

Yau's solution of the Calabi conjecture [22] produces a unique Calabi-Yau metric in each Kähler class on a compact Kähler manifold X with vanishing first Chern class. These metrics have local holonomy group contained in SU(n). They are fundamental objects in geometry. Yau's original construction is based on solving a fully nonlinear complex
