Two-phase thermosyphons are passive refrigeration devices that transfer heat against gravity. Construction is typically a closed-ended tubular vessel charged with a two-phase working fluid. The vapor phase of the working fluid fills the majority of the interior of the vessel, with the liquid phase filling the minority of the volume.

The thermosyphon shown in Fig 1.1 is a two-phase loop with a compact evaporator that employs microfabricated boiling enhancement structures made of high thermal conductivity materials. The thermosyphon prototype was developed as a joint effort between Hewlett-Packard Laboratories, Georgia Institute of Technology and Thermacore.

Two-Phase Loop: Compact Thermosyphon - HP Labs

In the present paper, we investigate the overall thermal resistance of a closed two-phase thermosyphon using pure water and various water based nanofluids (of Al₂O₃, CuO and Laponite clay) as working fluids. We observed that all these nanofluids show inferior thermal performance than pure water.

PERFORMANCE ANALYSIS OF CLOSED LOOP TWO PHASE THERMOSYPHON ...

Loop thermosyphons (LTS) are gravity-driven, two-phase devices that operate in a similar manner to a heat pipe in so far as a working fluid is evaporated and condensed in a closed loop to transfer heat over a given distance. Some readers may be more familiar with a traditional thermosyphon, shown in Figure 1a, where the liquid and vapor occupy a single tube.

Performance analysis of closed loop two phase thermosyphon ...

Thermosiphon (or thermosyphon) is a method of passive heat exchange, based on natural convection, which circulates a fluid without the necessity of a mechanical pump. Thermosiphoning is used for circulation of liquids and volatile gases in heating and cooling applications such as heat pumps, water heaters, boilers and furnaces.
