Food Processing is the first book of its kind to illustrate the use of CFD for solving heat and mass transfer problems in the food industry. Using a computational grid, CFD solves governing equations that describe fluid flow across each grid cell by means of an iterative procedure in order to predict and visualize the profiles of velocity, temperature, pressure, and other ...

Liquid is fed to the center of a rotating wheel with a peripheral velocity of 90–200 m/s. Droplets are produced typically in the range of 30–120  $\mu\text{m}$  sizes. The size of droplets produced from the nozzle varies directly with feed rate and feed viscosity, and inversely with wheel speed and wheel diameter.

In recent years, computational fluid dynamics (CFD) has been increasingly applied to food processing operations. In spray-drying operations, CFD simulation tools are now often used because measurements of air flow, temperature, particle size and humidity within the drying chamber are very difficult and expensive to obtain in large-scale dryer.
