molecular biology | Description & Topics | Britannica

Monomers of S protein, prior to glycosylation, are 128–160 kDa, but molecular masses of the glycosylated forms of full-length monomers fall in the range of 150–200 kDa. The S molecule is thus highly glycosylated, and this modification is exclusively N-linked (Holmes 1981, Rottier 1981). S protein ectodomains have from 19 to 39 potential consensus glycosylation sites, but a comprehensive mapping of actual glycosylation has not yet been reported for any coronavirus.
