Bore is the diameter of each cylinder while stroke is the distance traveled when the piston moves back and forth. Engine Conversion Chart. While engine displacement in modern society is typically measured in liters, older engines mainly used cubic inches to describe the engine size.

It doesn't matter if your LS is a Gen 3 or a Gen 4. It doesn't matter if it is cast iron or aluminum. For all LS engines with the same displacement, the bore and stroke are the same. The chart below lists the stock bore and stroke measurements. (Summit Racing's Brian Nutter and Paul Spurlock contributed to this article.)

The term "bore" refers to the diameter of a cylinder in a piston engine. If you're assembling or rebuilding an engine, knowing the bore of each cylinder will allow you to install pistons of an appropriate size to ensure adequate clearance during firing and prevent excess wear or other, more dangerous issues.

engine, the displacement would be: $\text{Displacement} = (4 \text{ in./}2) \times (4 \text{ in./}2) \times 3.1416 \times 3.52 \text{ in.} \times 8 = 353.86 \text{ cubic inches.}$

Bore = $\sqrt{[\text{displacement} \div (0.7854 \times \text{stroke} \times \text{number of cylinders})]}$ In the case of a 305 Chevy, the stroke is 3.48 inches, the same as a 350. By plugging in the known variables, you calculate the unknown bore dimension as follows. Bore = $\sqrt{[305 \div (0.7854 \times 3.48 \times 8)]} = 3.734 \text{ inches bore diameter}$ Calculator sequence:

In 1970, GM pushed the performance bar higher with the introduction of the Chevy 454 V8. Unlike the popular Chevy 427 that was used in a wide variety of automobiles, the 454 was used only in high performance cars like the Chevy Camaro, Corvette and Chevelle. There were 3 different variations of the 454 that came onto the drawing board at GM during the 70s; the LS5, the LS6, and the LS7 which ...

Displacement is used to calculate the compression ratio of an engine and is used to indicate the size of an engine. The formula to find engine displacement is: displacement = $\pi \times b^2 \times s \times c$. Where b is equal to the bore size, s is equal to the stroke length, and c is the number of cylinders.
