## **Human Anatomy Physiology Skeletal System**

Skeletal System Physiology. The primary functions of the skeletal system include movement, support, protection production of blood cells, storage of minerals and endocrine regulation. Support. The primary function of the skeletal system is to provide a solid framework to support and safeguard the human body and its organs.

## Skeletal System Worksheet

The skeletal system includes all of the bones, cartilages, and ligaments of the body that support and give shape to the body and body structures. The skeleton consists of the bones of the body. For adults, there are 206 bones in the skeleton. Younger individuals have higher numbers of bones because some bones fuse together during childhood and adolescence to form an adult bone.
