Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

The First Book of Plants is a beautifully illustrated science book geared towards upper elementary/middle school students and is very thorough in its presentation of plants as organisms, the different types of plants, the principles of their growth and reproduction, their various parts and life cycle. Some basic experiments are included.

Excerpt from Guide to the Study of Common Plants: An Introduction to Botany In the second edition, prepared in response to helpful suggestions from many teachers, a glossary and index, together with a chapter on fungi, have been added and several minor changes introduced. The arrangement remains substantially as before, but teachers who prefer to start with the simpler forms and proceed to the more highly developed ones can readily do so by beginning with the section on algae, instead of following the order of the book. To those who approach the work in a scientific spirit, it is super?uous to say that the student's intellectual life has a developmental history which it is quite as need ful to take into account as the genetic succession of plants. There can hardly be more interesting problems than those presented to the teacher in his relation to this higher realm of biological science.
