Probability is starting with  
an animal, and figuring out  
what footprints it will  
make. Statistics is seeing a  
footprint, and guessing the  
animal. Probability is  
straightforward: you have  
the bear. Measure the foot  
size, the leg length, and  
you can deduce the  
footprints.

A probability of one represents certainty: if you flip a coin, the probability you'll get heads or tails is one (assuming it can't land on the rim, fall into a black hole, or some such). The probability of getting a given number of heads from four flips is, then, simply the number of ways that number of heads can occur, divided by the number of total results of four flips, 16.
