Nondestructive testing (NDT) is a wide group of analysis techniques used in science and technology industry to evaluate the properties of a material, component or system without causing damage. The terms nondestructive examination (NDE), nondestructive inspection (NDI), and nondestructive evaluation (NDE) are also commonly used to describe this technology. [2]

Nondestructive testing - Wikipedia

Nondestructive evaluation (NDE) of wood and wood-based materials can be defined as any technique to acquire properties of these materials in a noninvasive manner. NDE is a broader term than nondestructive testing (NDT), which implies the determination of mechanical properties only.

Nowadays non-destructive testing methods such as computed tomography (CT) , , ultrasonic method , impact-echo method and acoustic emission (AE) technology , have been utilized to detect defects of grouting materials. Among them, although industrial CT can detect the grouted defects, it is currently limited to laboratory application due to the strict requirements of application conditions.
