The Mole Concept The purpose of this activity is to better understand the concepts of relative atomic mass, counting by weighing and the mole. Per cent composition and average atomic mass are also included. Part I. Relative Atomic Masses and the Mole – Early Method When John Dalton proposed his atomic theory, he stated that the atoms of each element had a characteristic mass.

In chemistry, there is a name for 6.02×10^{23} atoms, molecules or ions of a substance. That name is a "mole". You can count the number of moles of a substance by weighing the substance, because chemists know the mass of particular molecules -the "molar mass".

Counting large numbers is easier when you use counting units like a dozen, gross, etc. Chemists use the mole for very large numbers of items. Procedure:
1. Measure the length of a both paper clips to the nearest 0.1 cm
2. If a mole is 6.022×10^{23} items -

1. we used counting by weighing in this experiment though it would have been just as easy to count the pennies. In real life when would we count by weighing? 2. in part A of the lab, why do we measure the mass of 10 pennies to determine the mass of 1 penny? (Why not its weigh one penny?) 3. If you reached into a pile of copper and pulled out a single atom, would it have the mass calculated above?

Avogadro's number is an absolute number: there are 6.022×10^{23} elementary entities in 1 mole. This can also be written as $6.022 \times 10^{23} \text{ mol}^{-1}$. The mass of one mole of a substance is equal to that substance's molecular weight. For example, the mean molecular
