Novel Applications of Molecular Diagnostics in Infectious Diseases Molecular Typing In Bacterial Infections

The development of molecular genotyping methods has improved the classification and typing of microorganisms at the sub-species level. In Molecular Typing in Bacterial Infections , readers will find an ultimate guide to molecular methods for the classification and typing of most human bacterial pathogens, covering a wide range of techniques which can be easily applied to the investigation of infectious

Molecular Typing in Bacterial Infections covers common bacterial pathogenic agents, with the most effective methods for their identification and classification in the light of their specific epidemiology. The book will be a valuable resource for molecular typing of infectious diseases agents encountered in both the research and hospital clinical lab settings, as well as culture collections.

New molecular tools taking advantage of DNA-based approaches are highly relevant to epidemiological studies and they have expanded rapidly over the past 20 years. Molecular typing in bacterial infections, edited by de Filippis and McKee, is structured into seven parts: (I) General consideration of microorganism typing methods, (II)

limitations. Molecular methods represent the best alternative to identify bacterial strains isolated from diverse origins and to improve research in the context of molecular epidemiology. However, these methodologies are laborious and costly compared to phenotypic or classical techniques, and there are no reliable routine laboratories.
