MULTISYSTEM organ failure is a devastating condition most often associated with severe sepsis, but which can occur with other conditions such as trauma, pancreatitis, and burns. All of these conditions likely share a common pathway for the development of multiple system organ failure: diffuse activation of endothelium by proinflammatory cytokines, leukocytes, and other proteins.

Multiple organ failure (MOF) is a syndrome that represents a complicated and dynamic pathophysiologic pathway leading to organ functional derangement and eventual death. Severe hemorrhagic shock begins an inflammatory cascade that cannot be reversed in some patients despite adequate resuscitation.

Multiple organ dysfunction syndrome (MODS) is altered organ function in an acutely ill patient requiring medical intervention to achieve homeostasis.. Although Irwin-Rippe cautions in 2005 that the use of "multiple organ failure" or "multisystem organ failure" should be avoided, both Harrison's (2015) and Cecil's (2012) medical textbooks still use the terms "multi-organ
