Chemistry 1ce by Olmsted, Williams, Burk is a newly adapted general chemistry text designed for the specific needs and requirements of Canadian professors and students for use in one or two semester introductory chemistry courses. This adaptation was based on recommendations from an advisory board of instructors from leading institutions across Canada who worked with our Canadian author throughout the development of this text to reach a consensus on topics that best suit Canadian curriculum.

Olmsted/Burk Chemistry, Second Canadian Edition is an introductory general chemistry text designed specifically with Canadian instructors and students in mind. Canadian content in the form of SI units, IUPAC standards and research content more accurately reflects the discipline of Canadian chemistry, distinguishing this text from current text offerings which are primarily American. Canadian chemistry instructors will find this text sufficiently rigorous while still engaging and retaining student interest with accessible language, a concise and easy-to-use presentation of information, and a clear problem-solving program--without an excess of material that makes most texts appear daunting and redundant. This second edition includes more organic chemistry coverage, multi-concept problems, and increased student pedagogy.

Filling a gap in our systematic knowledge of gold, this monograph covers the fundamental aspects, while also considering new applications of gold compounds in catalysis, as nanoparticles, and their potential application as luminescent compounds. Written by an eminent team of authors from academia, the book analyzes the current status of gold chemistry, its special characteristics, oxidation states and main type of complexes, before going on to look at the synthesis of supramolecular aggregates due to the formation of gold-gold, gold-metal interactions or other secondary bonds. Final sections deal with LEDs, solvoluminescent and electroluminescent materials, liquid crystals and catalysis. While of interest to advanced chemistry students, this book is also useful for researchers interested in the chemistry of gold and its applications, as well as those involved in metal-metal interactions, heteronuclear chemistry or in the optical properties of coordination compounds.

"Every substance has physical properties that we can measure and describe, including shape, colour, and texture. For example, the iron girder shown in Figure 1.1 has a lustrous silvery colour and a smooth texture. Substances also have chemical properties, such as their flammability. Macroscopic physical and chemical properties can be observed with the eye. The underlying or microscopic structure of a chemical substance requires magnification to be observed. The magnified view of iron shown in Figure 1.1 reveals fissures and pits that are not visible in the macroscopic view. Still further magnification eventually reveals the building blocks of matter. This, the molecular or atomic view, is an essential part of every chemist's thinking"--
