This book is intended to show the experience of different professional teams, from different countries, who have been working with oral rehabilitation. This book is for DMD students, oral & maxillofacial surgeons, periodontists and prosthodontists. It comprises seven well-organized chapters showing more than 150 cases of oral rehabilitation, described along with explanations, with a special focus on crowns and dental implants.

This book acquaints the clinician with the full range of parameters that need to be considered before undertaking an esthetic rehabilitation with veneers and describes current clinical concepts and techniques. The initial chapters provide the foundation for a comprehensive treatment plan. It is explained how digital smile design in conjunction with a wax-up and functional esthetic prototype allow a patient to visualize the possibilities. Occlusion prior to the initiation of treatment and following treatment is key to the longevity of restorations, and this aspect is given careful consideration. Detailed advice is also offered on proper selection of materials and their placement. The guidance provided will ensure that the reader

is fully equipped to gather and assess all relevant information prior to commencement of the final treatment. The treatment itself can range from minimally invasive to more complex depending on the requirements of each individual case. Among the clinical concepts discussed in the book are the use of etched porcelain restorations, minimally invasive CAD/CAM veneers, and the ink glue technique.

The authors of this oral rehabilitation text advocate the controversial Twin-Stage Procedure which they discovered, explaining that it provides the means to control the amount of disocclusion that average doctors using previous procedures have been unable to control. The results of the Twin-Stage Procedure produce precise disocclusion without the measurement of condylar path, and follow gnathological principles of scientifically-supported patient treatment. Topics include the articulator, the Twin-Stage Procedure, clinical evaluation test, full mouth reconstruction, fixed restorations and occlusal adjustment, and occlusion for osseointegrated implants. Contains mathematical formulae for analyzing mandibular movement. Annotation copyrighted by Book News, Inc., Portland, OR

Introduction: Based on the experience gained with oral rehabilitation in patients with cancer submitted to therapies with antiresorptive and/or antiangiogenic agents combined with scientific evidence in databases, this case series aims to describe oral rehabilitation recommended by the Clinical Research Center at Bauru School of Dentistry of the University of Su00e3o Paulo. We described specific management of the patient during the rehabilitation process and the choice of the most suitable dental prosthesis. Methods: Methods were investigated in scientific literature for rehabilitation to minimize the chances of MRONJ that may be caused by trauma related to these prostheses, as well as the management of these patients during the rehabilitation clinical stages. Results: Eight patients with history of cancer and submitted to an antineoplastic therapy which may cause MRONJ were treated with dental prostheses according to their specific needs and limitations. No patient was diagnosed with post rehabilitation MRONJ. Follow-up period ranged from 3 to 41 months. Conclusions: Dental rehabilitation considering systemic limitations imposed by MRONJ, excluding clinical stages that may bring harm to both soft tissues and bone like extended surgeries, implants and conventional removable prostheses seems to be possible and favorable. However, it is cleared the need for more solid evidence described in literature.

The discipline of dental implantology is one of the scientific medical/dental fields that are moving dynamically very fast. Not to mention the multiple specialties involved in managing the service as well as the research production. As much as it is necessary to have books to review the basics of bone healing, cellular biology, and implant rehabilitation planning, it is very critical to have more focused books to link the dots and elevate the benchmark of success even higher, especially when facing the reality of more advanced case challenges nowadays. "Dental Implantology and Biomaterial" presents four main sections covering topics of clinically applied "tips and tricks", the reality of transmucosal implant surface, the future of ceramic implants, the revolution of implant surface treatment, and finally the application of nonautogenous graft in the treatment process. The aim is updating the practitioners, researchers, and postgraduate trainees in the field with up-to-date clinically applied topics focused on reducing the gap between research and clinical application. Doing so will not only optimize the practice but also advance it with evidence-based maneuvers and technical details.

This book is designed to help dentists in general practice to improve the results of prosthetic procedures in medically compromised and elderly patients. In particular, it critically scrutinizes various dogmas that govern practitioners' approaches yet lack sound scientific support and often have an adverse effect on outcomes. Attention is drawn to straightforward procedures that offer significant clinical benefits and to aspects that are too often neglected, such as the impact of systemic diseases. New light is cast, for example, on the taking of dental impressions, the treatment of malocclusions, the making of jaw relation records, the relationship between denture quality and patient satisfaction, and the use of implant-supported overdentures versus traditional complete prostheses (dentures). As Albert Einstein once said, "It is what we think we know that prevents us from learning more." Readers will find that this book helps them to re-examine taken-for-granted elements of their practice, leading to improved care and patient satisfaction.

Decision Making in Dental Implantology: Atlas of Surgical and Restorative Approaches offers an image-based resource to both the surgical and restorative aspects of implant therapy, presenting more than 2,000 color images with an innovative case-by-case approach. Takes a highly pictorial approach to all aspects of implant dentistry Discusses both the surgical and restorative aspects of implant therapy in a single resource Describes a wide range of clinical scenarios likely to be encountered in daily practice Covers anterior, posterior, and full-mouth restorations Presents more than 2,000 color images showing the basic concepts and clinical cases

Wiley-Blackwell's "Clinical Cases" series is designed to recognize the centrality of clinical cases to the profession by providing actual cases with an academic backbone. Clinical Cases in Prosthodontics grounds itself in core principles of this rehabilitative specialty and demonstrates their practical, every-day application through range of case presentations building from simple to complex and from common to rare. This unique approach supports the new trend in case-based and problem-based learning, thoroughly covering topics ranging from conventional complete denture prostheses to full mouth rehabilitation using both implant and tooth-supported prostheses. Each case begins with a short description of the initial patient presentation and the learning objectives and goals the subsequent case discussion will demonstrate. This is accompanied by relevant medical and dental histories, notes on extra-oral and soft tissue examination and a thorough list of clinical findings, all presented in bulleted form to facilitate ease of learning. Clinical decision making factors are then discussed in detail, well illustrated with multiple clinical photos showing progressive stages of treatment. Cases conclude with review questions and relevant literature citations supporting each answer. Ideal for practitioners and students alike, Clinical Cases in Prosthodontics is the ultimate resource linking evidence-based research to every-day application.
