Handlers: running operations on change#. Sometimes you want a task to run only when a change is made on a machine. For example, you may want to restart a service if a task updates the configuration of that service, but not if the configuration is unchanged.

[Handlers: running operations on change — Ansible Documentation](#)

For Ansible, nearly every YAML file starts with a list. Each item in the list is a list of key/value pairs, commonly called a “hash” or a “dictionary”. So, we need to know how to write lists and dictionaries in YAML. There’s another small quirk to YAML.

[YAML Syntax — Ansible Documentation](#)

Ansible can work with networks, load balancers, monitoring systems, web services and other devices that might need touching during a rolling update. For example, you can add or remove servers from your load balancing pool and disable monitoring alerts for each machine that is being updated.

If your Ansible inventory fluctuates over time, with hosts spinning up and shutting down in response to business demands, the static inventory solutions described in How to build your inventory will not serve your needs. You may need to track hosts from multiple sources: cloud providers, LDAP, Cobbler, and/or enterprise CMDB systems. Ansible integrates all of these options through a dynamic ...
