### **The Feeling of What Happens - Rutgers University**

Developed in his (1999) book, *The Feeling of What Happens*, Antonio Damasio's three layered theory of consciousness is based on a hierarchy of stages, with each stage building upon the last. The most basic representation of the organism is referred to as the Protoself, next is Core Consciousness, and finally, Extended Consciousness. Damasio, who is an internationally recognized leader in ...

Does it only happen when you've been active, or when you're not doing anything? Is there any pain when you breathe? Do you have a cough? Do certain positions make it worse – for example, are you unable to lie down? Feeling like you can't get enough air can be terrifying, but doctors are well trained in managing this. You may be given extra oxygen to breathe if this is needed. Causes of ...

A new theory of consciousness and the construction of identity focuses on the body's reaction to its world, postulating that a complex relationship between body, emotion, and mind is required to configure the self. Reprint. 50,000 first printing.

There have been many ambitious and important books on the problem of consciousness in the past few years. None has quite the philosophical sophistication and neurophysical knowledge of this one. One of the world's leading experts on the neurophysiology of emotion, professor Damasio shows how our consciousness developed out of the development of emotion brilliantly wide ranging, with fascinating case-studies, the book presents a humane and subtle view of the facility that makes us most profoundly human.

Investigates the cerebral mechanisms behind emotions and feelings to explain the role between emotion, survival, and cultural accomplishment.

From one of the world's leading neuroscientists: a succinct, illuminating, wholly engaging investigation of how biology, neuroscience, psychology, and artificial intelligence have given us the tools to unlock the mysteries of human consciousness In recent decades, many philosophers and cognitive scientists have declared the problem of consciousness unsolvable, but Antonio Damasio is convinced that recent findings across multiple scientific disciplines have given us a way to understand consciousness and its significance for human life. In the forty-eight brief chapters of Feeling & Knowing, and in writing that remains faithful to our intuitive sense of what feeling and experiencing are about, Damasio helps us understand why being conscious is not the same as sensing, why nervous systems are essential for the development of feelings, and why feeling opens the way to consciousness writ large. He combines the latest discoveries in various sciences with philosophy and discusses his original research, which has transformed our understanding of the brain and human behavior. Here is an indispensable guide to understanding how we experience the world within and around us and find our place in the universe.

"A pathbreaking investigation into homeostasis, the condition of that regulates human physiology within the range that makes possible not only the survival but also the flourishing of life. Antonio Damasio

makes clear that we descend biologically, psychologically, and even socially from a long lineage that begins with single living cells; that our minds and cultures are linked by an invisible thread to the ways and means of ancient unicellular life and other primitive life-forms; and that inherent in our very chemistry is a powerful force, a striving toward life maintenance that governs life in all its guises, including the development of genes that help regulate and transmit life."--Supplied by publisher.

Linking the process of rational decision making to emotions, a scientist who has done extensive research with brain-damaged patients notes the dependence of thought processes on feelings and the body's survival-oriented regulators. Reprint.

An argument that consciousness, more widespread than previously assumed, is the feeling of being alive, not a type of computation or a clever hack. In *The Feeling of Life Itself*, Christof Koch offers a straightforward definition of consciousness as any subjective experience, from the most mundane to the most exalted--the feeling of being alive. Psychologists study which cognitive operations underpin a given conscious perception. Neuroscientists track the neural correlates of consciousness in the brain, the organ of the mind. But why the brain and not, say, the liver? How can the brain, three pounds of highly excitable matter, a piece of furniture in the universe, subject to the same laws of physics as any other piece, give rise to subjective experience? Koch argues that what is needed to answer these questions is a quantitative theory that starts with experience and proceeds to the brain. In *The Feeling of Life Itself*, Koch outlines such a theory, based on integrated information. Koch describes how the theory explains many facts about the neurology of consciousness and how it has been used to build a clinically useful consciousness meter. The theory predicts that many, and perhaps all, animals experience the sights and sounds of life; consciousness is much more widespread than conventionally assumed. Contrary to received wisdom, however, Koch argues that programmable computers will not have consciousness. Even a perfect software model of the brain is not conscious. Its simulation is fake consciousness. Consciousness is not a special type of computation--it is not a clever hack. Consciousness is about being.

"In *The Power of Strangers*, journalist Joe Keohane takes us through an inquiry into our shared history, one that offers surprising and compelling insights into our own social and political moment. But if strangers seem to some to be the problem, history, data, and science show us that they are actually our solution. In fact, throughout human history, our address to the stranger, the foreigner, the marginalized, and the other has determined the fate and well-being of both nations and individuals. A raft of new science confirms that the more we open ourselves up to encounters with those we don't know, the healthier we are. Modern cities are vast clusters of strangers. Technology has driven many of us into silos of isolation. Through deep immersion with sociologists, psychologists, neuroscientists, theologians, philosophers, political scientists and historians, Keohane learns about how we're wired to sometimes fear, distrust, and even hate strangers; what happens to us--as individuals, groups, and as a culture--when we indulge those biases; and at the same time, he digs into a growing body of cutting-edge research on the surprising social and psychological benefits that come from talking to strangers; how even passing interactions with strangers can enhance empathy, happiness, and cognitive development, ease loneliness and isolation, and root us in the world, deepening our sense of belonging; how paradoxically, strangers can help us become more fully ourselves. Keohane explores the ways in which biology, culture, and history have defined us and our understanding of people we don't know"--

A book that fundamentally changes how neuroscientists and psychologists categorize sensations and understand the origins and significance of human feelings *How Do You Feel?* brings together startling evidence from neuroscience, psychology, and psychiatry to present revolutionary new insights into how our brains enable us to experience the range of sensations and mental states known as feelings. Drawing on his own cutting-edge research, neurobiologist Bud Craig has identified an area deep inside the mammalian brain--the insular cortex--as the place where interoception, or the processing of bodily stimuli, generates feelings. He shows how this crucial pathway for interoceptive awareness gives rise in humans to the feeling of being alive, vivid perceptual feelings, and a subjective image of the sentient self across time. Craig explains how feelings represent activity patterns in our brains that signify emotions, intentions, and thoughts, and how integration of these patterns is driven by the unique energy needs of the hominid brain. He describes the essential role of feelings and the insular cortex in such diverse realms as music, fluid intelligence, and bivalent emotions, and relates these ideas to the philosophy of William James and even to feelings in dogs. *How Do You Feel?* is also a compelling insider's account of scientific discovery, one that takes readers behind the scenes as the astonishing answer to this neurological puzzle is pursued and pieced together from seemingly unrelated fields of scientific inquiry. This book will fundamentally alter the way that neuroscientists and psychologists categorize sensations and understand the origins and significance of human feelings.

Humphrey's principal paper is followed by commentaries on Humphrey's theory, which consist of ten essays by various authors, and then followed by Humphrey's reply to commentators.
