Description There are a number of  
conditions for which regional  
anaesthesia to allow surgery is  
required for a specific part of the  
body. This technique aims to provide  
accurate placement of local  
anaesthetic by using ultrasound  
guidance to position needles that  
deliver the local anaesthetic in the  
correct place next to the nerves.

Finally, the ability of ultrasound-guided regional anesthesia to become the “holy grail” of regional anesthesia—providing neural blockade with rapid onset, long duration, and improved success, without complications—has recently been discussed.<sup>13</sup> Although many advocates of ultrasound theorize that direct visualization of neural targets and needle advancement may decrease the frequency (and severity) of neurologic injury, preliminary results do not support the hypothesis that ultrasound ...
