Construction Specification - Shotcrete

Shotcrete is both a material and a method. The material is concrete, mortar or grout. The method is the application of this material by pneumatic pressure through a specially adapted hose. There are two basic types of shotcrete: in one, the materials are combined in a central mixer and then transported through a hose, out the nozzle and into place; in the other, the dry ingredients are combined, transported through a hose and mixed with water at the nozzle.

Mix Design Hints for Shotcrete - Concrete Construction

Unlike the dry-mix process, the wet concrete mix greets air at the nozzle before shooting. Because the wet-mix process relies on a ready-mix plant, the variables are less, well, variable. "Most of the batching is controlled at the plant," says Drakeley, "So you ask for a certain mix and you should be relatively sure, as long as you know your ready-mix company, that that's what you are going to get." The importance of the velocity of the shot cannot be overstated.
